

ABSTRACT OF THE DISCLOSURE

A liquid crystal display device has a gate line  
formed on a substrate, and a gate insulating film  
deposited thereon. On the gate insulating film are  
5 provided a source line, and a conductive layer above  
the gate line. An insulating layer is formed thereon,  
and a pixel electrode is then provided. The  
conductive layer does not contact the source line,  
10 and at least two portions of the conductive layer are  
electrically connected with the gate line.
